ABSTRACT:

CHG DATE=19990617 STATUS=O> For the extreme reduction of the health-damaging consequences of cigarette smoking, as a cigarette replacement a plaster is prepared which contains a nicotine depot which releases a daily amount of nicotine customary for smokers directly through the epidermis more or less continuously into the human blood stream. Further application possibilities of the nicotine-containing depot plaster consist in use of portions of plaster in stepwise weaning-off, and also as a slimming agent, utilising the appetite-inhibiting side effect of nicotine.
